#### Classification

Given the dataset  $(x_i, y_i)$  for i = 1, 2, ..., N, find a function f(x) (model) so that it can predict the label  $\hat{y}$  for some input x, even if it is not in the dataset, i.e.  $\hat{y} = f(x)$ 

- Positive : y = 1
- Negative : y = 0

Need for a new Model			

What would happen if we used the linear regression model:

 $\hat{y} = w_0 + w_1 x$ 

- ▶ *y* is 0 or 1
- ▶  $\hat{y}$  will take any value between  $-\infty$  and  $\infty$
- ▶ It will be hard to find  $w_0$  and  $w_1$  that make the prediction  $\hat{y}$  match the label y

Linear Classification	Lab I	Multiclass Classification	Lab II
၀၀၀၀၀၀၀၀၀၀၀၀၀၀၀	oo	ooooo	oo
Sigmoid Function			

By appling the sigmoid function, we enforce  $0 \le \hat{y} \le 1$ 

$$\hat{y} = \text{sigmoid}(w_0 + w_1 x) = \frac{1}{1 + e^{-(w_0 + w_1 x)}}$$

Linear Classification	Lab I	Multiclass Classification	Lab II

# MSE vs. Binary Cross Entropy Loss

- MSE of a logistic function has many local minima
- Binary Cross Entropy loss has only one minimum

Linear Classification	Lab I	Multiclass Classification	Lab II
ooooooooooooooo	oo	00000	oo
Classifier			

$$\hat{y} = \text{sigmoid}(w_0 + w_1 x) = \frac{1}{1 + e^{-(w_0 + w_1 x)}}$$

How to deal with uncertainty?

▶ Thanks to the sigmoid,  $\hat{y} = f(x)$  is between 0 and 1

Linear Classification	Lab I	Multiclass Classification	Lab II
୦୦୦୦୦୦୦୦୦୦୦୦୦୦	oo	00000	oo
Classifier			

$$\hat{y} = \text{sigmoid}(w_0 + w_1 x) = \frac{1}{1 + e^{-(w_0 + w_1 x)}}$$

How to deal with uncertainty?

- ▶ Thanks to the sigmoid,  $\hat{y} = f(x)$  is between 0 and 1
- ▶ If  $\hat{y}$  is close to 0, the data is probably negative
- If  $\hat{y}$  is close to 1, the data is probably positive
- If  $\hat{y}$  is around 0.5, we are not sure.

#### Performance metrics for a classifier

- Accuracy of a classifier: percentage of correct classification
- Why accuracy alone is not a good measure for assessing the model?

Linear Classification	Lab I	Multiclass Classification	Lab II
oooooooooooooooo	oo	ooooo	oo

#### Performance metrics for a classifier

- Accuracy of a classifier: percentage of correct classification
- Why accuracy alone is not a good measure for assessing the model?
  - Example: A rare disease occurs 1 in ten thousand people
  - A test that classifies everyone as free of the disease can achieve 99.999% accuracy when tested with people drawn randomly from the entire population

Linear Classification	Lab I	Multiclass Classification	Lab II
ooooooooooooooooo	oo	00000	oo

### Types of Errors in Classification

- Correct predictions:
  - True Positive (TP) : Predict  $\hat{y} = 1$  when y = 1
  - True Negative (TN) : Predict  $\hat{y} = 0$  when y = 0
- Two types of errors:
  - False Positive/ False Alarm (FP):  $\hat{y} = 1$  when y = 0
  - False Negative/ Missed Detection (FN):  $\hat{y} = 0$  when y = 1

Linear Classification	Lab I	Multiclass Classification	Lab II
	oo	00000	oo

#### Exercise

- ▶ How many True Positives (TP) are there?
- How many True Negatives (TN) are there?
- How many False Positives (FP) are there?
- How many False Negatives (FN) are there?

Linear Classification	Lab I	Multiclass Classification	Lab II
ooooooooooooooooooo	oo	00000	oo

#### Exercise

- ► True Positives (TP) = 8
- True Negatives (TN) = 9
- False Positives (FP) = 1
- ► False Negatives (FN) = 2

Linear Classification	Lab I	Multiclass Classification	Lab II
000000000000000	oo	ooooo	oo
Other Metrics			

Sensitivity/Recall/TPR (How many positives are detected among all positive?)

# $\frac{\mathsf{TP}}{\mathsf{TP}+\mathsf{FN}}$

Precision (How many detected positives are actually positive?)

 $\frac{\mathsf{TP}}{\mathsf{TP} + \mathsf{FP}}$

# Multiclass Classification

Previous Model:

$$f(x) = \sigma(\phi(x)w)$$

- Representing Multiple Classses:
  - One-hot / 1-of-K vectors, ex : 4 Class

- Class 
$$l: y = [1, 0, 0, 0]$$

- Class 2 : 
$$y = [0, 1, 0, 0]$$

- Class 3 : 
$$y = [0, 0, 1, 0]$$

- Class 4 : y = [0, 0, 0, 1]

oooooooooooooooo	oo	oo●oo	oo

# Multiclass Classfication

Multiple outputs:

 $f(x) = \operatorname{softmax}(\phi(x)W)$ 

▶ Shape of  $\phi(x)W$ :  $(N,K) = (N,D) \times (D,K)$ 

Softmax:

$$\mathsf{softmax}(z_k) = rac{e^{z_k}}{\sum_j e^{z_j}}$$

Softmax Example			

Linear Classification	Lab I	Multiclass Classification	Lab II
oooooooooooooooo	oo	oooo●	oo
Cross-Entropy			

- Multple Outputs:  $\hat{y}_i = \text{softmax}(\phi(x_i)W)$
- Cross-Entropy:

$$J(W) = -\sum_{i=1}^{N} \sum_{k=1}^{K} y_{ik} \log(\hat{y_{ik}})$$

▶ Example, K = 4, if  $y_i = [0, 0, 1, 0]$  then,

$$\sum_{k=1}^{K} y_{ik} \log(\hat{y_{ik}}) = \log(\hat{y_{i3}})$$
